Technical SEO Issues Breakdown (14 Detected)

Issue Summary	Impact	Root Cause & Diagnosis	Automated Recommendation
2 pages are returning HTTP error status codes	Critical	Broken pages return 404 or server error responses, disrupting user navigation and depleting search crawl budget.	Repair broken URLs or set up permanent 301 redirects to active, relevant pages.
1 page has meta descriptions over 160 characters	Minor	Meta descriptions exceeding 160 characters are truncated by search engines with ellipses in search snippets.	Shorten meta description to 120-155 characters to ensure complete visibility in search results.
27 pages have title tags under 30 characters	Minor	Short title tags miss valuable keyword opportunities and convey insufficient context to search engines.	Expand title tag to 40-60 characters incorporating primary service keywords and brand name.
3 pages are canonicalised to another URL	Important	The rel="canonical" tag points to a different URL, instructing Google not to index this specific page.	Ensure canonical tags point to themselves unless the page is intentionally a duplicate or staging variant.
20 pages have no heading tag	Important	Pages without an H1 tag lack semantic hierarchy, weakening topical authority in search algorithms.	Add a single descriptive **heading at the top of each page content section.**
63 images are missing descriptive alt text	Minor	Image search crawlers and screen readers cannot understand image context without descriptive alt attributes.	Add specific, descriptive alt attributes explaining the subject matter and intent of each image.

Issue Summary	Impact	Root Cause & Diagnosis	Automated Recommendation
19 pages have thin content (under 300 words)	Minor	Pages with less than 300 words are vulnerable to quality penalties and struggle to rank for competitive keywords.	Expand page copy with comprehensive value propositions, FAQs, testimonials, and detailed service descriptions.
19 pages lack structured JSON-LD schema	Minor	Structured data enables rich snippets in Google SERPs and powers entity citation in AI Search (Perplexity, ChatGPT, Claude).	Inject Schema.org JSON-LD definitions (Organization, Service, FAQPage, Article) into the page .
25 pages have duplicate title tags	Important	Duplicate title tags cause search engines to cannibalize keywords between identical pages rather than ranking them individually.	Assign distinct, descriptive title tags to each page reflecting its specific purpose.
23 pages have duplicate meta descriptions	Minor	Duplicate meta descriptions reduce SERP CTR because searchers cannot distinguish the unique value of each page.	Craft unique meta descriptions tailored to the specific content and call to action of each page.
19 pages lack a canonical tag	Important	Pages without a rel="canonical" tag risk duplicate content penalties if accessible via multiple URL variations.	Add a self-referential tag to every indexable page.
Valid SSL / HTTPS encryption active across all crawled URLs	Passed	All pages are served over a secure TLS connection, protecting user data and maintaining positive Google ranking signals.	No action needed. SSL certificate is active and properly routing traffic.
Mobile-responsive viewport meta tag detected across crawled pages	Passed	The viewport tag ensures optimal readability, touch ergonomics, and rendering on mobile and tablet displays.	No action needed. Mobile responsive configuration is validated.
48 of 50 pages verified with 200 OK HTTP status	Passed	The web server promptly responds with standard 200 OK headers, confirming origin availability and crawl accessibility.	No action needed. Server routing is healthy.
